County confirms 2nd, 3rd rabid bat

Woodstock IL – McHenry County Department of Health (MCDH) confirms its 2nd and 3rd rabid bat – both in Woodstock – with one resident receiving rabies preventative treatment. It is strongly recommended that residents not release a bat but contain it in a room, under a bucket or blanket and keep people away from it. In order to test bats for rabies, it is important they be in good condition – either alive or recently deceased. Specimens that are in good condition and test negative for rabies eliminates the need for rabies treatment. McHenry County Animal Control should be contacted immediately (815-459-6222).

The State Health Department has reported 16 rabid bats state-wide. Lake, Kane, Cook and Will County are among those reporting rabid bats in 2010 in addition to central and southern counties. The best way to avoid rabies is to avoid exposure. Rabies is a deadly disease caused by a virus that attacks the central nervous system and can only be confirmed in a laboratory. Residents are encouraged to take a “hands off” approach to wild animals to reduce their risk of exposure. Parents also need to educate their children of the dangers.

Keeping pets up to date with vaccinations will not only keep them from getting rabies but also provide a barrier of protection for you if your animal is bitten by a rabid animal. Most bats leave in the fall or winter to hibernate so these are the best times to “bat-proof” your home.

A bat that is active by day, found in a place where bats are not usually seen (such as in your home, in a swimming pool or on the lawn) or is unable to fly, is more likely than others to be rabid. A rabies fact sheet is available at the Illinois Dept of Public Health

www.idph.state.il.us/public/hb/hbrabies.htm.

Questions about exposure should be directed to MCDH’s Communicable Disease Program at 815-334-4500.
